Liver and spleen from a 20 week-post conception male fetus. 1st strand cDNA was primed with a Pac I - oligo(dT) primer [5' ARCGARGARTARTTRATGRATTTTTTTTTTTTTTTT], double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Pac I and cloned into the Pac I and Eco RI sites of the modified pTTT vector. Library went through one round of normalization. Library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      for the produc of the protein, opt. after being mutated to produce NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr= 114,952). The protein (or variants) can be used in treatment of natriuretic peptide disorders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The sequence was derived from the DNA encoding natriuretic peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              receptor B, NPRB, having guanyl cyclase (GC) activity and protein kinase activity. The DNA can be inserted into expression vectors

kidney failure, heart failure, hyperaldosteronism, glaucoma etc.	snrnrhrnhdnnrnrngvhtgnvcagvvgnkmnrycnr
Claim 3; Fig 1; 49pp; English. The sequence was derived from the DNA encoding natriuretic peptide	: : : : : : : :
receptor B, NPRB, having guanyl cyclase (GC) activity and protein	
s activity. The DNA can be inserted into expression vectors he brodn. of the protein, obt. after being mutated to produce	RESULT.
NPRB analogues. The protein has a mol wt. of 115 kD (calculated Mr=	
52). The protein (or variants) can be used in treatment of	AC Q51746;
natintetic peptide uisolders, and also to isolate peptides using affinity chromatography. Antibodies with affinity for NPRB can	Di 31-MAI-1994 (IIISt entry) DE Oligonucleotide probe MK14-A
also be prepd.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     þű
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       leotide probes specific for Mycobacteria - used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     e 14; 23pp; English.

ide probe MK14-A consists of nucleotides 5-95 of N thybridized to all spp. of mycobacteria tested, the of few non-mycobacterial spp. The probe may an initial screen for mycobacterial infection.

735-45 and 62174-59.

The wild type sequence was obtained as a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     transcriptase and the molecules are completed to forms that can be amplified and then expressed in a suitable host-vector system. The sequence covers all 176 difft base substitutions, most of which
                                                                                                                                                                                                                                       Claim 3; Page 14; 23pp; English.
Oligonucleotide probe MK14-A consists of nucleotides 5-95 of MK14
(051735). It hybridized to all spp. of mycobacteria tested, but cross reacted to a few non-mycobacterial spp. The probe may
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            single stranded template and an oligonucleotide was hybridised to

Plasmid pCisEBON (a pRK5 derivative) is an episomal CMV driven
Plasmid pCisEBON (a pRK5 derivative) is an episomal CMV driven
activity were produced by site-directed mutagenesis. Stable
populations of preferred HGF variants were obtained by transfecting
human embryonic kidney 293 cells and then these were subcloned in
pCisEBON. See R52940-R52949 for examples of pref. HGF variants.

purine at -3 and/or a G at +4 then the reading frame is numbered from the A of the ATG to the base preceding the termination codon. If there is no obvious initiation codon or there is a substantial codon that satisfies the rules of Kozak [12] in that there is a reading frame in phase before the ATG then the reading frame is numbered from the first base of the first codon.

SITEs of POLYA signals

This feature lists all occurences of the sequence AATAAA which is found normally approximately 20 bases upstream of the mRNA processing/polyA addition site. The rarely used homolog ATTAAA is only listed when it is found in a position close to the end of a major reading frame

SITEs of DONOR and ACCEPT sequences

This is not a comprehensive listing of all such sequences and only the positions of a few have been noted because they occur in potentially interesting positions. The number quoted in the table the position of the terminal base in the intron in each case.

Restriction enzyme SITEs.

Only the positions of the sites Bam HI (BAM) are listed.

RPT

used to define repetitive sequences. įs feature This

SITE DEL

strains such as RAJI and also to deletions in other strains such as This feature defines deletions in B95-8 with respect to other P3HR1 and DAUDI with respect to B95-8,

SITE HPN

sequences with twofold symmetry ie could form hairpin this is not a comprehensive list - only a few occurences loops. This Denotes

ORGRPL

Denotes the region that encompasses an origin of replication (ori P).[13]

NUMBER ING

home/pandya/spector252491/US-08-252-491-18 rge Sep 28 00:04

DNA sequence of B95-8 EBV has been revised [19]. The original (Baer et al, 1984) base 359 has been deleted so the new sequence around that position reads TCAGTCTT. To avoid renumbering the entire sequence, position 1 has benn moved 1 base to the left of the EcoRI site separating EcoRI Dhet from EcoRI I (ie the first A of AGAATTC).

NCBI gi: 59074

gives 4.1kb late RNA. Probably encodes non glycosylated 140kd protein in membrane antigen. Also two latent RNAs spliced underneath this RNA, lengths 1.8 and 2.0kb (Hudson et al, 1985). The longer one encodes terminal protein. 1736..5692 'note="TATA: TATTAAA BN-R1 late promoter before BNRF1, 'note="BNRF1 reading frame, 5 NXT/S; NCBI gi: 59075" /note="exon 2 terminal protein RNA" /note="exon 3 terminal protein RNA" 'note="exon 4 terminal protein RNA" protein RNA" protein RNA" protein RNA /note="exon 8 terminal protein RNA /organism="Epstein-Barr virus" /note="polyA signal: AATAAA" /note="exon 5 terminal 'note="exon 7 terminal /note="exon 6 terminal /note="TATA: TATAAAG" 1691 'note="TATA: TATAAAT" 'note="TATA: CATAAAA" Location/Qualifiers /strain="B95-8" complement (1192) complement (1383) complement (535) 1026..1196 1280..1495 1574..1682 360..458 540..788 871..951 9191 misc feature promoter promoter promoter promoter source LENA mRNA **mRNA** mRNA **IIRNA** mRNA mRNA CDS FEATURES
